Algorithms and Data Structures Cheatsheet

We summarize the performance characteristics of classic algorithms and data structures for sorting, priority queues, symbol tables, and graph processing.

We also summarize some of the mathematics useful in the analysis of algorithms, including commonly encountered functions; useful formulas and approximations; properties of logarithms; asymptotic notations; and solutions to divide-and-conquer recurrences.

Sorting.

The table below summarizes the number of compares for a variety of sorting algorithms, as implemented in this textbook. It includes leading constants but ignores lower-order terms.

| ALGORITHM | CODE | IN PLACE | STABLE | BEST | AVERAGE | WORST | REMARKS |
|----------------|--------------------------------|----------|--------|-----------------------|-------------------|-------------------|---|
| selection sort | Selection.java | ✓ | | $\frac{1}{2} n^2$ | $\frac{1}{2} n^2$ | $\frac{1}{2} n^2$ | n exchanges; quadratic in best case |
| insertion sort | Insertion.java | ✓ | ✓ | n | $\frac{1}{4} n^2$ | $\frac{1}{2} n^2$ | use for small or partially-sorted arrays |
| bubble sort | Bubble.java | ✓ | ✓ | n | $\frac{1}{2} n^2$ | $\frac{1}{2} n^2$ | rarely useful; use insertion sort instead |
| shellsort | Shell.java | ✓ | | $n \log_3 n$ | unknown | $c n^{3/2}$ | tight code; subquadratic |
| mergesort | Merge.java | | ✓ | $\frac{1}{2} n \lg n$ | $n \lg n$ | $n \lg n$ | $n \log n$ guarantee; stable |
| quicksort | Quick.java | ✓ | | $n \lg n$ | $2 n \ln n$ | $\frac{1}{2} n^2$ | $n \log n$ probabilistic guarantee; fastest in |

| | | | | | | |
|----------|---------------------------|---|---------------|------------|------------|--|
| heapsort | Heap.java | ✓ | n^{\dagger} | $2n \lg n$ | $2n \lg n$ | practice |
| | | | | | | $n \log n$ guarantee; in place |
| | | | | | | $\dagger n \lg n$ if all keys are distinct |

Priority queues.

The table below summarizes the order of growth of the running time of operations for a variety of priority queues, as implemented in this textbook. It ignores leading constants and lower-order terms. Except as noted, all running times are worst-case running times.

| DATA STRUCTURE | CODE | INSERT | DEL-MIN | MIN | DEC-KEY | DELETE | MERGE |
|----------------|--|------------|--------------------|-----|---------------|--------------------|----------|
| array | BruteIndexMinPQ.java | 1 | n | n | 1 | 1 | n |
| binary heap | IndexMinPQ.java | $\log n$ | $\log n$ | 1 | $\log n$ | $\log n$ | n |
| d -way heap | IndexMultiwayMinPQ.java | $\log_d n$ | $d \log_d n$ | 1 | $\log_d n$ | $d \log_d n$ | n |
| binomial heap | IndexBinomialMinPQ.java | 1 | $\log n$ | 1 | $\log n$ | $\log n$ | $\log n$ |
| Fibonacci heap | IndexFibonacciMinPQ.java | 1 | $\log n^{\dagger}$ | 1 | 1^{\dagger} | $\log n^{\dagger}$ | 1 |

\dagger amortized guarantee

Symbol tables.

The table below summarizes the order of growth of the running time of operations for a variety of symbol tables, as implemented in this textbook. It ignores leading constants and lower-order terms.

| DATA STRUCTURE | CODE | worst case | | | average case | | |
|---|---|------------|----------|----------|--------------|----------|------------------|
| | | SEARCH | INSERT | DELETE | SEARCH | INSERT | DELETE |
| sequential search (in an unordered list) | SequentialSearchST.java | n | n | n | n | n | n |
| binary search (in a sorted array) | BinarySearchST.java | $\log n$ | n | n | $\log n$ | n | n |
| binary search tree (unbalanced) | BST.java | n | n | n | $\log n$ | $\log n$ | $\text{sqrt}(n)$ |
| red-black BST | RedBlackBST.java | $\log n$ | $\log n$ | $\log n$ | $\log n$ | $\log n$ | $\log n$ |

(left-leaning)

| | | | | | | | |
|--|---|----------|----------|----------|-------------|-------------|-------------|
| AVL | AVLTreeST.java | $\log n$ | $\log n$ | $\log n$ | $\log n$ | $\log n$ | $\log n$ |
| hash table (separate-chaining) | SeparateChainingHashST.java | n | n | n | 1^\dagger | 1^\dagger | 1^\dagger |
| hash table (linear-probing) | LinearProbingHashST.java | n | n | n | 1^\dagger | 1^\dagger | 1^\dagger |

 † uniform hashing assumption

Graph processing.

The table below summarizes the order of growth of the worst-case running time and memory usage (beyond the memory for the graph itself) for a variety of graph-processing problems, as implemented in this textbook. It ignores leading constants and lower-order terms. All running times are worst-case running times.

| PROBLEM | ALGORITHM | CODE | TIME | SPACE |
|---------------------------------------|-----------------|--|------------|---------|
| path | DFS | DepthFirstPaths.java | $E + V$ | V |
| shortest path (fewest edges) | BFS | BreadthFirstPaths.java | $E + V$ | V |
| cycle | DFS | Cycle.java | $E + V$ | V |
| directed path | DFS | DepthFirstDirectedPaths.java | $E + V$ | V |
| shortest directed path (fewest edges) | BFS | BreadthFirstDirectedPaths.java | $E + V$ | V |
| directed cycle | DFS | DirectedCycle.java | $E + V$ | V |
| topological sort | DFS | Topological.java | $E + V$ | V |
| bipartiteness / odd cycle | DFS | Bipartite.java | $E + V$ | V |
| connected components | DFS | CC.java | $E + V$ | V |
| strong components | Kosaraju–Sharir | KosarajuSharirSCC.java | $E + V$ | V |
| strong components | Tarjan | TarjanSCC.java | $E + V$ | V |
| strong components | Gabow | GabowSCC.java | $E + V$ | V |
| Eulerian cycle | DFS | EulerianCycle.java | $E + V$ | $E + V$ |
| directed Eulerian cycle | DFS | DirectedEulerianCycle.java | $E + V$ | V |
| transitive closure | DFS | TransitiveClosure.java | $V(E + V)$ | V^2 |
| minimum spanning tree | Kruskal | KruskalMST.java | $E \log E$ | $E + V$ |
| minimum spanning tree | Prim | PrimMST.java | $E \log V$ | V |
| minimum spanning tree | Boruvka | BoruvkaMST.java | $E \log V$ | V |
| shortest paths (nonnegative weights) | Dijkstra | DijkstraSP.java | $E \log V$ | V |

| | | | | |
|--|---------------------------|--|---------------------|-------|
| shortest paths (no negative cycles) | Bellman–Ford | BellmanFordSP.java | $V(V + E)$ | V |
| shortest paths (no cycles) | topological sort | AcyclicSP.java | $V + E$ | V |
| all-pairs shortest paths | Floyd–Warshall | FloydWarshall.java | V^3 | V^2 |
| maxflow–mincut | Ford–Fulkerson | FordFulkerson.java | $E \sqrt{V(E + V)}$ | V |
| bipartite matching | Hopcroft–Karp | HopcroftKarp.java | $V^{1/2}(E + V)$ | V |
| assignment problem | successive shortest paths | AssignmentProblem.java | $n^3 \log n$ | n^2 |

Commonly encountered functions.

Here are some functions that are commonly encountered when analyzing algorithms.

| FUNCTION | NOTATION | DEFINITION |
|----------------------------------|-----------------------|--|
| floor | $\lfloor x \rfloor$ | greatest integer $\leq x$ |
| ceiling | $\lceil x \rceil$ | smallest integer $\geq x$ |
| binary logarithm | $\lg x$ or $\log_2 x$ | y such that $2^y = x$ |
| natural logarithm | $\ln x$ or $\log_e x$ | y such that $e^y = x$ |
| common logarithm | $\log_{10} x$ | y such that $10^y = x$ |
| iterated binary logarithm | $\lg^* x$ | 0 if $x \leq 1$; $1 + \lg^*(\lg x)$ otherwise |
| harmonic number | H_n | $1 + 1/2 + 1/3 + \dots + 1/n$ |
| factorial | $n!$ | $1 \times 2 \times 3 \times \dots \times n$ |
| binomial coefficient | $\binom{n}{k}$ | $\frac{n!}{k! (n-k)!}$ |

Useful formulas and approximations.

Here are some useful formulas for approximations that are widely used in the analysis of algorithms.

- *Harmonic sum:* $1 + 1/2 + 1/3 + \dots + 1/n \sim \ln n$
- *Triangular sum:* $1 + 2 + 3 + \dots + n = n(n + 1)/2 \sim n^2/2$
- *Sum of squares:* $1^2 + 2^2 + 3^2 + \dots + n^2 \sim n^3/3$
- *Geometric sum:* If $r \neq 1$, then $1 + r + r^2 + r^3 + \dots + r^n = (r^{n+1} - 1) / (r - 1)$
 - $r = 1/2$: $1 + 1/2 + 1/4 + 1/8 + \dots + 1/2^n \sim 2$
 - $r = 2$: $1 + 2 + 4 + 8 + \dots + n/2 + n = 2n - 1 \sim 2n$, when n is a power of 2

- *Stirling's approximation:* $\lg(n!) = \lg 1 + \lg 2 + \lg 3 + \dots + \lg n \sim n \lg n$
- *Exponential:* $(1 + 1/n)^n \sim e$; $(1 - 1/n)^n \sim 1/e$
- *Binomial coefficients:* $\binom{n}{k} \sim n^k / k!$ when k is a small constant
- *Approximate sum by integral:* If $f(x)$ is a monotonically increasing function, then

$$\int_0^n f(x) dx \leq \sum_{i=1}^n f(i) \leq \int_1^{n+1} f(x) dx$$

Properties of logarithms.

- *Definition:* $\log_b a = c$ means $b^c = a$. We refer to b as the *base* of the logarithm.
- *Special cases:* $\log_b b = 1$, $\log_b 1 = 0$
- *Inverse of exponential:* $b^{\log_b x} = x$
- *Product:* $\log_b(x \times y) = \log_b x + \log_b y$
- *Division:* $\log_b(x \div y) = \log_b x - \log_b y$
- *Finite product:* $\log_b(x_1 \times x_2 \times \dots \times x_n) = \log_b x_1 + \log_b x_2 + \dots + \log_b x_n$
- *Changing bases:* $\log_b x = \log_c x / \log_c b$
- *Rearranging exponents:* $x^{\log_b y} = y^{\log_b x}$
- *Exponentiation:* $\log_b(x^y) = y \log_b x$

Asymptotic notations: definitions.

| NAME | NOTATION | DESCRIPTION | DEFINITION |
|------------------|--------------------------|--|---|
| Tilde | $f(n) \sim g(n)$ | $f(n)$ is equal to $g(n)$ asymptotically (including constant factors) | $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = 1$ |
| Big Oh | $f(n)$ is $O(g(n))$ | $f(n)$ is bounded above by $g(n)$ asymptotically (ignoring constant factors) | there exist constants $c > 0$ and $n_0 \geq 0$ such that $0 \leq f(n) \leq c \cdot g(n)$ for all $n \geq n_0$ |
| Big Omega | $f(n)$ is $\Omega(g(n))$ | $f(n)$ is bounded below by $g(n)$ asymptotically (ignoring constant factors) | $g(n)$ is $O(f(n))$ |
| Big Theta | $f(n)$ is $\Theta(g(n))$ | $f(n)$ is bounded above and below by $g(n)$ asymptotically (ignoring constant factors) | $f(n)$ is both $O(g(n))$ and $\Omega(g(n))$ |
| Little oh | $f(n)$ is $o(g(n))$ | $f(n)$ is dominated by $g(n)$ asymptotically | $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = 0$ |

| | | | |
|-------------------------|-----------------------------|---|---------------------|
| | | (ignoring constant factors) | |
| Little omega | $f(n)$ is $\omega(g(n))$ | $f(n)$ dominates $g(n)$ asymptotically (ignoring constant factors) | $g(n)$ is $o(f(n))$ |

Common orders of growth.

| NAME | NOTATION | EXAMPLE | CODE FRAGMENT |
|---------------------|---------------|--|---|
| Constant | $O(1)$ | array access arithmetic operation function call | <code>op();</code> |
| Logarithmic | $O(\log n)$ | binary search in a sorted array insert in a binary heap search in a red-black tree | <code>for (int i = 1; i <= n; i = 2*i) op();</code> |
| Linear | $O(n)$ | sequential search grade-school addition BFPRM median finding | <code>for (int i = 0; i < n; i++) op();</code> |
| Linearithmic | $O(n \log n)$ | mergesort heapsort fast Fourier transform | <code>for (int i = 1; i <= n; i++) for (int j = i; j <= n; j = 2*j) op();</code> |
| Quadratic | $O(n^2)$ | enumerate all pairs insertion sort grade-school multiplication | <code>for (int i = 0; i < n; i++) for (int j = i+1; j < n; j++) op();</code> |
| Cubic | $O(n^3)$ | enumerate all triples Floyd-Warshall grade-school matrix multiplication | <code>for (int i = 0; i < n; i++) for (int j = i+1; j < n; j++) for (int k = j+1; k < n; k++) op();</code> |
| Polynomial | $O(n^c)$ | ellipsoid algorithm for LP AKS primality algorithm Edmond's matching algorithm | |
| Exponential | $2^{O(n^c)}$ | enumerating all subsets enumerating all permutations backtracking search | |

Asymptotic notations: properties.

- *Reflexivity:* $f(n)$ is $O(f(n))$.
- *Constants:* If $f(n)$ is $O(g(n))$ and $c > 0$, then $c \cdot f(n)$ is $O(g(n))$.
- *Products:* If $f_1(n)$ is $O(g_1(n))$ and $f_2(n)$ is $O(g_2(n))$, then $f_1(n) \cdot f_2(n)$ is $O(g_1(n) \cdot g_2(n))$.

- *Sums:* If $f_1(n)$ is $O(g_1(n))$ and $f_2(n)$ is $O(g_2(n))$, then $f_1(n) + f_2(n)$ is $O(\max\{g_1(n), g_2(n)\})$.
- *Transitivity:* If $f(n)$ is $O(g(n))$ and $g(n)$ is $O(h(n))$, then $f(n)$ is $O(h(n))$.
- *Polynomials:* Let $f(n) = a_0 + a_1n + \dots + a_dn^d$ with $a_d > 0$. Then, $f(n)$ is $\Theta(n^d)$.
- *Logarithms and polynomials:* $\log_b n$ is $O(n^d)$ for every $b > 0$ and every $d > 0$.
- *Exponentials and polynomials:* n^d is $O(r^n)$ for every $r > 0$ and every $d > 0$.
- *Factorials:* $n!$ is $2^{\Theta(n \log n)}$.
- *Limits:* If $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = c$ for some constant $0 < c < \infty$, then $f(n)$ is $\Theta(g(n))$.
- *Limits:* If $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = 0$, then $f(n)$ is $O(g(n))$ but not $\Theta(g(n))$.
- *Limits:* If $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \infty$, then $f(n)$ is $\Omega(g(n))$ but not $O(g(n))$.

Here are some examples.

| FUNCTION | $o(n^2)$ | $O(n^2)$ | $\Theta(n^2)$ | $\Omega(n^2)$ | $\omega(n^2)$ | $\sim 2n^2$ | $\sim 4n^2$ |
|--------------------|----------|----------|---------------|---------------|---------------|-------------|-------------|
| $\log_2 n$ | ✓ | ✓ | | | | | |
| $10n + 45$ | ✓ | ✓ | | | | | |
| $2n^2 + 45n + 12$ | | ✓ | ✓ | ✓ | | ✓ | |
| $4n^2 - 2\sqrt{n}$ | | ✓ | ✓ | ✓ | | | ✓ |
| $3n^3$ | | | | ✓ | ✓ | | |
| 2^n | | | | ✓ | ✓ | | |

Divide-and-conquer recurrences.

For each of the following recurrences we assume $T(1) = 0$ and that $n/2$ means either $\lfloor n/2 \rfloor$ or $\lceil n/2 \rceil$.

| RECURRENCE | $T(n)$ | EXAMPLE |
|------------------------------|--|--------------------------|
| $T(n) = T(n/2) + 1$ | $\sim \lg n$ | binary search |
| $T(n) = 2T(n/2) + n$ | $\sim n \lg n$ | mergesort |
| $T(n) = T(n-1) + n$ | $\sim \frac{1}{2}n^2$ | insertion sort |
| $T(n) = 2T(n/2) + 1$ | $\sim n$ | tree traversal |
| $T(n) = 2T(n-1) + 1$ | $\sim 2^n$ | towers of Hanoi |
| $T(n) = 3T(n/2) + \Theta(n)$ | $\Theta(n^{\log_2 3}) = \Theta(n^{1.58\dots})$ | Karatsuba multiplication |

$$T(n) = 7T(n/2) + \Theta(n^2)$$

$$\Theta(n^{\log_2 7}) = \Theta(n^{2.81\dots})$$

Strassen multiplication

$$T(n) = 2T(n/2) + \Theta(n \log n)$$

$$\Theta(n \log^2 n)$$

closest pair

Master theorem.

Let $a \geq 1$, $b \geq 2$, and $c > 0$ and suppose that $T(n)$ is a function on the non-negative integers that satisfies the divide-and-conquer recurrence

$$T(n) = a T(n/b) + \Theta(n^c)$$

with $T(0) = 0$ and $T(1) = \Theta(1)$, where n/b means either $\lfloor n/b \rfloor$ or either $\lceil n/b \rceil$.

- If $c < \log_b a$, then $T(n) = \Theta(n^{\log_b a})$
- If $c = \log_b a$, then $T(n) = \Theta(n^c \log n)$
- If $c > \log_b a$, then $T(n) = \Theta(n^c)$

Remark: there are many different versions of the master theorem. The [Akra–Bazzi theorem](#) is among the most powerful.
